

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-07 22:55:55

Cancer Type: Brain

Report ID: ECC5BEA1

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Pituitary	100.0%	99 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with pituitary (confidence 100.0%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

The AI model suggests a high-risk diagnosis of pituitary cancer, with a very high confidence level of 100% based on the image patterns strongly and clearly consistent with this finding. The risk level is classified as High Risk, with a score of 99/100, indicating an urgent need for further evaluation and management. The full probability distribution shows a clear dominance of the pituitary class, with no significant competition from other classes, such as glioma or meningioma, which are often associated with different clinical presentations and treatment approaches. The Grad-CAM heatmap highlights a specific region of interest, which may aid in further characterization of the tumor. Given the high risk level and the need for precise diagnosis and treatment planning, it is essential to consult a neuro-oncologist and neurosurgeon to confirm the diagnosis and discuss the best course of action. This AI-assisted screening result should be considered as a preliminary indication, and a definitive diagnosis should be made through further clinical evaluation and diagnostic testing.
