

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-07 22:35:41

Cancer Type: Brain

Report ID: EBB5CFCD

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Notumor	91.3%	8 / 100	Low Risk

Diagnostic Summary

No malignant pattern detected. Model confidence: 91.3%. Routine monitoring is still recommended.

AI-Generated Clinical Recommendation

The AI model suggests that the medical image is highly consistent with a non-tumorous finding, with a very high confidence level of 91.3%, indicating that the image patterns strongly support this interpretation. However, the presence of a small but non-negligible probability of Glioma (8.6%) suggests that there may be some uncertainty in the interpretation, warranting a differential diagnosis consideration. The low risk level of 8/100 implies that this finding is unlikely to be a serious concern, but routine follow-up is still recommended. The Grad-CAM heatmap highlights a specific region of interest that may be relevant for further evaluation. Given the complexity of brain tumors, it is essential to consult a neuro-oncologist and neurosurgeon for a comprehensive evaluation and to rule out any potential malignancies. This AI-assisted screening result should not be considered a definitive diagnosis, but rather a starting point for further clinical evaluation and investigation.
