

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-07 23:19:42

Cancer Type: Skin

Report ID: 2F0A6FB8

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Malignant	95.31%	95 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with malignant (confidence 95.31%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

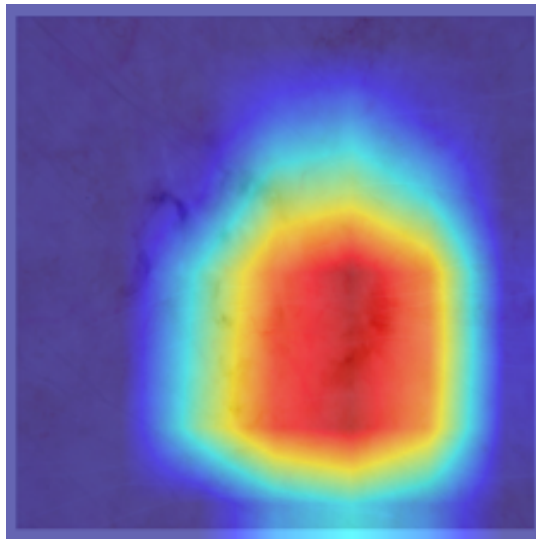

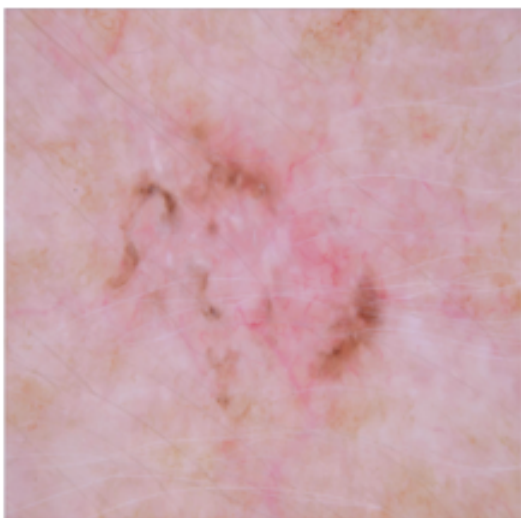

The AI model suggests a high likelihood of malignant skin cancer, with a very high confidence level of 95.3% based on the image analysis, indicating that the image patterns are strongly and clearly consistent with this finding. The risk level is classified as High Risk, with a score of 95/100, necessitating urgent evaluation and consultation. Given the strong competition between the malignant and benign classes, with a probability distribution showing a clear dominance of the malignant class, the differential diagnosis should also include consideration of other skin lesions that may mimic this appearance. The Grad-CAM heatmap highlights a specific region of interest that warrants further examination. I strongly recommend consulting a dermatologist and, given the high risk level, a dermatologic oncologist as soon as possible for a thorough evaluation and definitive diagnosis, keeping in mind that this is an AI-assisted screening result and not a definitive diagnosis.
