

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-05 19:41:02

Cancer Type: Brain

Report ID: 43296492

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Pituitary	100.0%	99 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with pituitary (confidence 100.0%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

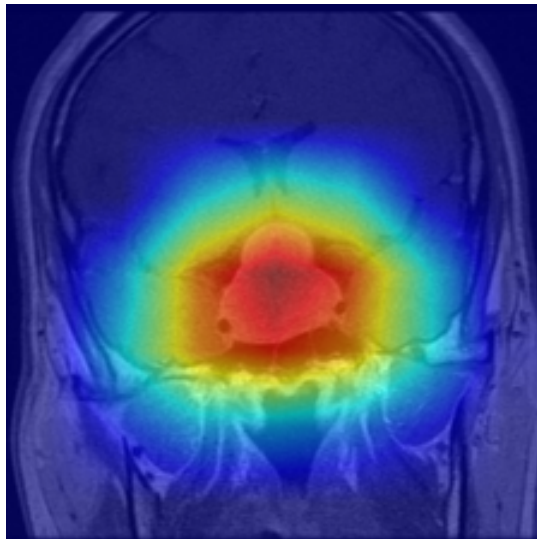

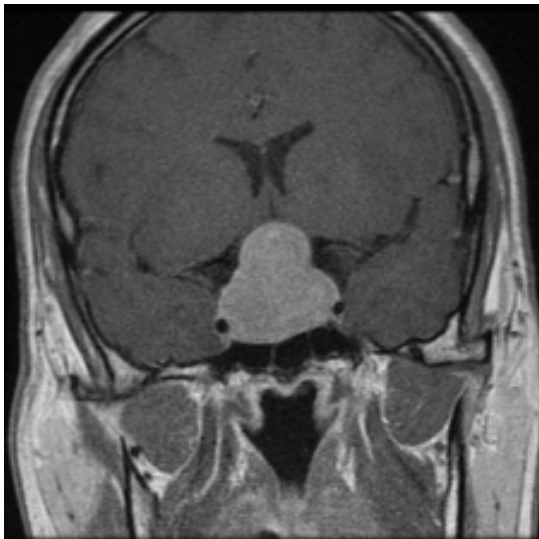

The AI model suggests a high-risk finding of a pituitary tumor, with a very high confidence level of 100.0% based on the image patterns, which are strongly and clearly consistent with this diagnosis. The full probability distribution shows a clear dominance of the pituitary class, with negligible probabilities for glioma, meningioma, and non-tumor classes, indicating a high degree of certainty in the AI analysis. However, it is essential to consider a differential diagnosis, as the absence of other tumor types does not rule out their possibility entirely. Given the high risk level of 99/100, it is crucial to expedite further evaluation and management, and I strongly recommend consulting a neuro-oncologist and neurosurgeon as soon as possible to discuss the best course of action for this patient. This AI-assisted screening result should be considered a preliminary finding, and a definitive diagnosis can only be established through further clinical evaluation and diagnostic testing.
