

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-05 19:36:03

Cancer Type: Brain

Report ID: A68E5A48

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Pituitary	100.0%	99 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with pituitary (confidence 100.0%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

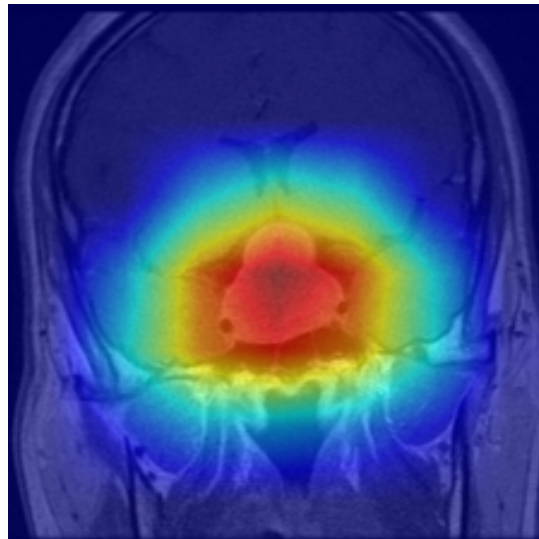

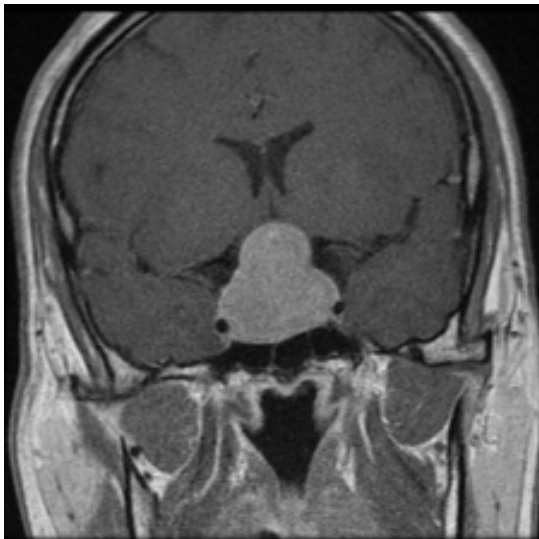

The AI model suggests a high-risk finding of a pituitary tumor, with a very high confidence level of 100.0%, indicating that the image patterns are strongly and clearly consistent with this diagnosis. The full probability distribution shows a clear dominance of the pituitary class, with minimal competition from other classes, suggesting a relatively low uncertainty in the diagnosis. However, given the high risk level of 99/100, it is essential to proceed with caution and consider a differential diagnosis, including glioma and meningioma, although the AI analysis indicates these are less likely. In light of the high risk level, I strongly recommend consulting a neuro-oncologist and neurosurgeon to discuss the findings and determine the best course of action, as a timely and accurate diagnosis is crucial in managing this condition. This is an AI-assisted screening result, and a definitive diagnosis should be confirmed through further clinical evaluation and diagnostic testing.
