

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-07 22:49:28

Cancer Type: Brain

Report ID: 348842D5

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Pituitary	100.0%	99 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with pituitary (confidence 100.0%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

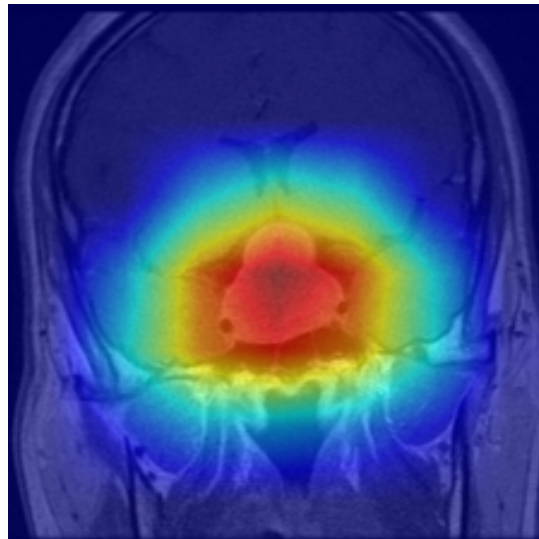

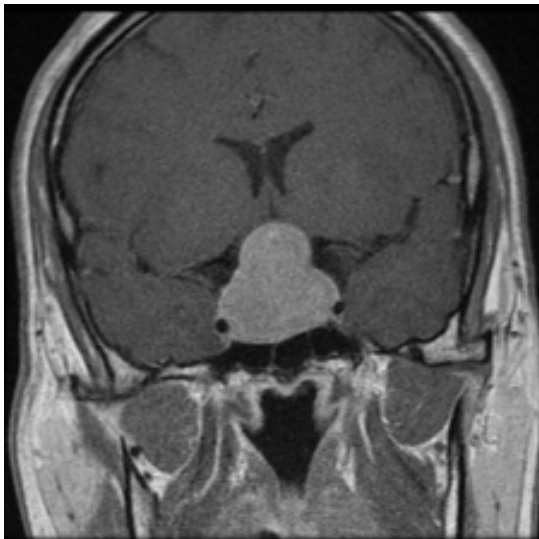

The AI model suggests a high-risk finding of a pituitary tumor, with a very high confidence level in the image analysis, indicating that the image patterns are strongly and clearly consistent with this diagnosis. However, it is essential to note that the probability distribution shows a complete absence of competition from other classes, which may indicate a high degree of certainty but also warrants further investigation to rule out other potential differential diagnoses, such as glioma or meningioma, which are not supported by the current image analysis. Given the high risk level and the urgent nature of this finding, it is crucial to expedite further evaluation and management, and we recommend consulting a neuro-oncologist and neurosurgeon as soon as possible to discuss the optimal treatment plan and any necessary interventions. The Grad-CAM heatmap may provide additional information on the specific region of interest, but its interpretation should be done in conjunction with a specialist. It is essential to remember that this is an AI-assisted screening result, and a definitive diagnosis should only be made after a comprehensive clinical evaluation and further diagnostic testing.
