

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-07 22:47:59

Cancer Type: Brain

Report ID: 3C4DC2A7

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Pituitary	100.0%	99 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with pituitary (confidence 100.0%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

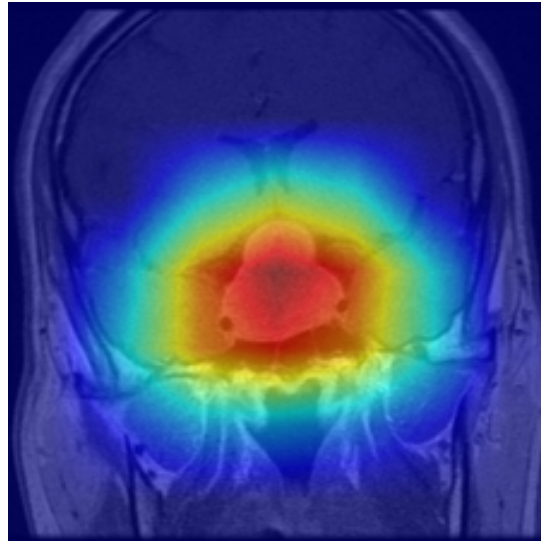

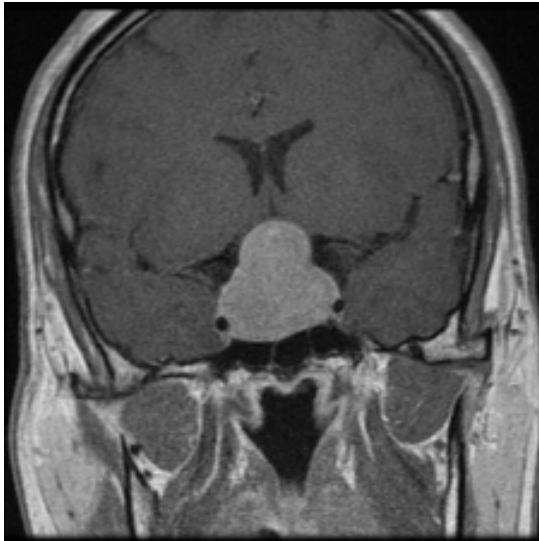

The AI model suggests a high-risk diagnosis of Pituitary cancer, with a very high confidence level of 100.0%, indicating that the image patterns are strongly and clearly consistent with this finding. However, it is essential to note that the probability distribution shows a complete absence of competition from other classes, which is unusual given the complexity of brain cancer diagnosis, and a differential diagnosis of Glioma or Meningioma cannot be entirely ruled out without further investigation. Given the high risk level and urgent nature of this finding, it is crucial to consult a neuro-oncologist and neurosurgeon as soon as possible to confirm the diagnosis and discuss treatment options. The Grad-CAM heatmap indicates that the AI model has identified a specific region of interest in the image, but without further analysis, it is difficult to determine the exact significance of this finding. This result should be considered as AI-assisted screening, not a definitive diagnosis, and further evaluation by a specialist is necessary to confirm the presence and nature of any tumor.
