

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-05 19:41:06

Cancer Type: Brain

Report ID: E14C2D78

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Notumor	91.3%	8 / 100	Low Risk

Diagnostic Summary

No malignant pattern detected. Model confidence: 91.3%. Routine monitoring is still recommended.

AI-Generated Clinical Recommendation

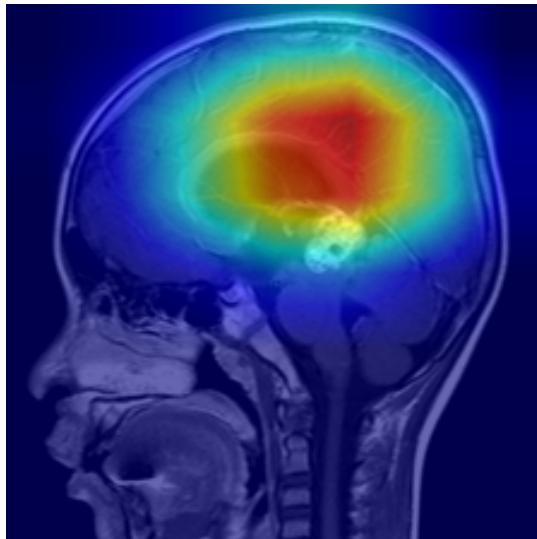

The AI model suggests that the medical image is highly suggestive of a non-tumorous finding, with a very high confidence level of 91.3%, indicating that the image patterns are strongly and clearly consistent with this interpretation. However, the probability distribution also reveals a notable second-class probability of 8.6% for Glioma, which warrants consideration of differential diagnosis, particularly given the low risk level of 8/100 and the corresponding low risk category. This suggests that while the likelihood of a non-tumorous finding is high, there is a possibility of a glioma, and further evaluation is necessary to rule out this possibility. In light of this, it is essential to consult a neuro-oncologist and neurosurgeon to discuss the findings and determine the best course of action, which may involve further imaging or diagnostic procedures. This AI-assisted screening result should be interpreted as a preliminary indication, and a definitive diagnosis should only be made after comprehensive clinical evaluation and specialist consultation.
