

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-04-07 22:46:41

Cancer Type: Brain

Report ID: 343CC2DB

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Pituitary	100.0%	99 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with pituitary (confidence 100.0%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

The AI model suggests a high-risk diagnosis of Pituitary cancer, with a very high confidence level of 100.0%, indicating that the image patterns are strongly and clearly consistent with this finding. However, it is essential to consider the full probability distribution, which shows a complete absence of patterns indicative of Glioma, Meningioma, or non-tumor conditions, suggesting that these differential diagnoses can be ruled out. Given the high risk level of 99/100, it is crucial to expedite further evaluation and treatment, and I strongly recommend consulting a neuro-oncologist and neurosurgeon as soon as possible to confirm the diagnosis and discuss the best course of action. The Grad-CAM heatmap highlights a specific region of interest, which should be further investigated during the specialist consultation. This AI-assisted screening result should be considered as a preliminary indication, not a definitive diagnosis, and a comprehensive clinical evaluation by a specialist is necessary to confirm the findings.
