

Multi-Cancer Diagnostic Report

AI-Assisted Screening · ResNet-18 + Grad-CAM

Generated: 2026-05-03 00:07:32

Cancer Type: Skin

Report ID: 881721C2

Prediction Summary

Prediction	Confidence	Risk Score	Risk Level
Malignant	79.5%	79 / 100	High Risk

Diagnostic Summary

Potential cancer-like pattern detected consistent with malignant (confidence 79.5%). Immediate clinical verification is strongly recommended.

AI-Generated Clinical Recommendation

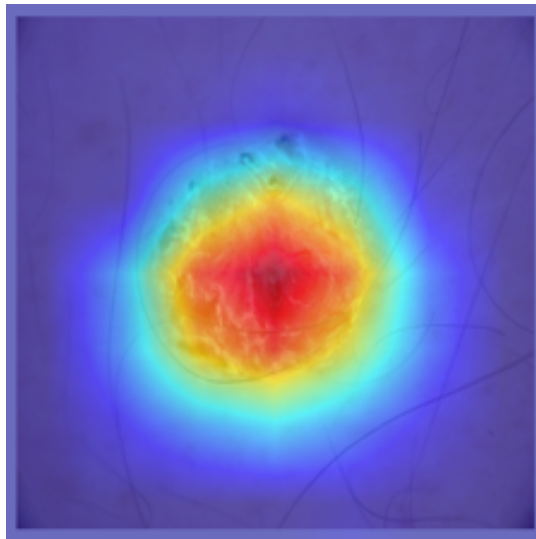

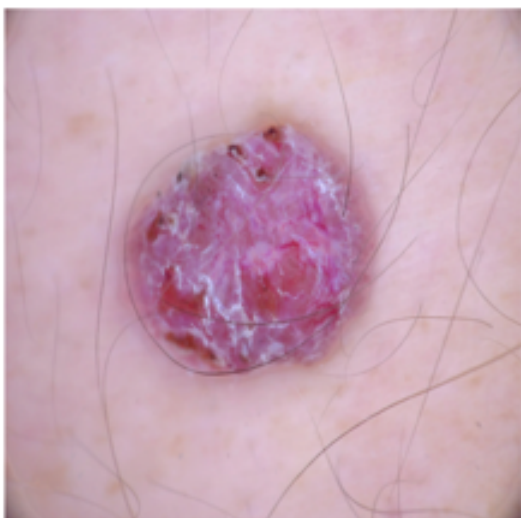

- The AI model suggests image features most consistent with Malignant, with confidence 79.5%, and this should be interpreted together with the full clinical picture.
- Arrange prompt specialist review without delay. Current risk score is 79/100, which should guide how quickly the case is reviewed.
- The uploaded image appears bright, soft-contrast, and warm-toned, so interpretation should be correlated with image quality and the original study.
- Grad-CAM shows a focal attention pattern centered in the mid-zone central region, which can help prioritize what to review first. Focus of follow-up: Emphasize urgent dermatology review, dermoscopy, possible biopsy planning, documentation with lesion photography, and avoiding delay if the lesion is changing, bleeding, ulcerating, or darkening. Consult dermatologist and dermatologic oncologist; this is an AI-assisted screening output and not a confirmed diagnosis.
